EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Richard Nakashima on 8/26/2008.

The application has been amended as follows:

1. (currently amended) A method for increasing the target-specific toxicity of a chemotherapeutic agent, comprising:

a) pretargeting an enzyme to a mammalian target site, wherein said pretargeting comprises (i) administering a bispecific antibody or binding fragment thereof, wherein one arm of the bispecific antibody is targeted against a target site antigen and a second arm is targeted against a low molecular weight hapten that is conjugated to said enzyme and (ii) administering a low molecular weight hapten that is conjugated to said enzyme; and

b) administering a cytotoxic chemotherapeutic agent known to act at the target site, or a prodrug form thereof which is converted to the chemotherapeutic agent in situ, which chemotherapeutic agent is also detoxified to form an intermediate of lower toxicity using said mammal's ordinary metabolic processes, whereby the detoxified intermediate is reconverted to its more toxic form by the pretargeted enzyme and thus has enhanced cytotoxicity at the target site, wherein said hapten is DTPA or a DTPA chelate.

4. (currently amended) The method of claim 1, wherein said bispecific antibody or binding fragment thereof ~~antibody fragment~~ comprises murine, chimeric or humanized antibodies or binding fragments thereof ~~antibody fragments~~.

5. (currently amended) A method for increasing the target-specific toxicity of a chemotherapeutic agent, comprising:

a) pretargeting an enzyme to a mammalian target site, wherein said pretargeting comprises (i) administering a bispecific antibody or binding fragment thereof, wherein one arm of the bispecific

antibody is targeted against a target site antigen and a second arm is targeted against a low molecular weight hapten that is conjugated to said enzyme and (ii) administering a low molecular weight hapten that is conjugated to said enzyme; and

b) administering a cytotoxic chemotherapeutic agent known to act at the target site, or a prodrug form thereof which is converted to the chemotherapeutic agent in situ, which chemotherapeutic agent is also detoxified to form an intermediate of lower toxicity using said mammal's ordinary metabolic processes, whereby the detoxified intermediate is reconverted to its more toxic form by the pretargeted enzyme and thus has enhanced cytotoxicity at the target site, wherein said prodrug is the cancer chemotherapy agent CPT-11, and said detoxified intermediate is SN-38-glucuronide.

8. (currently amended) A method for increasing the target-specific toxicity of a chemotherapeutic agent, comprising:

a) pretargeting an enzyme to a mammalian target site, wherein said pretargeting comprises (i) administering a bispecific antibody or binding fragment thereof, wherein one arm of the bispecific antibody is targeted against a target site antigen and a second arm is targeted against a low molecular weight hapten that is conjugated to said enzyme and (ii) administering a low molecular weight hapten that is conjugated to said enzyme; and

b) administering a cytotoxic chemotherapeutic agent known to act at the target site, or a prodrug form thereof which is converted to the chemotherapeutic agent in situ, which chemotherapeutic agent is also detoxified to form an intermediate of lower toxicity using said mammal's ordinary metabolic processes, whereby the detoxified intermediate is reconverted to its more toxic form by the pretargeted enzyme and thus has enhanced cytotoxicity at the target site, wherein a second enzyme, which can convert the prodrug to the chemotherapeutic agent, also is conjugated to said hapten, and wherein the second enzyme also is pretargeted to said target site.

13. (currently amended) A method for increasing the target-specific toxicity of a chemotherapeutic agent, comprising:

a) pretargeting an enzyme to a mammalian target site, wherein said pretargeting comprises(i) administering a bispecific antibody or binding fragment thereof, wherein one arm of the bispecific antibody is targeted against a target site antigen and a second arm is targeted against a low molecular

weight hapten that is conjugated to said enzyme; and (ii) administering a low molecular weight hapten that is conjugated to said enzyme; and
b) administering a cytotoxic chemotherapeutic agent known to act at the target site, or a prodrug form thereof which is converted to the chemotherapeutic agent in situ, which chemotherapeutic agent is also detoxified to form an intermediate of lower toxicity using said mammal's ordinary metabolic processes, whereby the detoxified intermediate is reconverted to its more toxic form by the pretargeted enzyme and thus has enhanced cytotoxicity at the target site, wherein, a clearing agent is administered to remove non-targeted pretargeting molecules and/or enzymes from said mammal's circulation prior to administration of said chemotherapeutic agent or prodrug, and said clearing agent is an antibody that binds said hapten.

14. (currently amended) The method of claim 11, wherein said enzyme is conjugated to a Mab and said clearing agent is an anti-idiotypic antibody or anti-idiotypic antibody binding fragment thereof which is specific for the paratope of said Mab.

49. (currently amended) The method of claim 1, wherein said antibody binding fragment thereof comprises an Feb, Fab', F(ab)2, F(ab')2 or scFv fragment.
